Value chain performance across crops and value chain stages

Fruit value chain performance varied considerably at both the indicator and stage levels. Overall, median expert responses at the indicator level across crops ranged from 0 to 60%. Detailed expert estimates regarding each indicator and stage for all crops are presented in Table S1.

Table S1. Summary of median expert response data with interquartile range (Q1–Q3) across fruit crops and indicators

Value chain stages	No	Indicators	Pomegranate	Apple	Cherry	Citrus (oranges)	Grape	Peach	Plum	Apricot	Almond	Fig	Pine nut	Pistachio	Walnut	Indicator Median	Stage Median (%)	Interquartile Range (IQR)	
																		Q1	Q3
Orchard establishment	1	Intensive orchard cultivation	72	88	58	58	88	88	72	58	58	30	2	21	12	**58**	**58**	**37**	**58**
	2	Orchards with certified nurseries	35	58	21	44	21	44	30	44	30	2	2	2	8	**30**	**58**	**37**	**58**

Quality standards and certification schemes

The expert response distribution showed varied responses regarding the availability and coverage of standards and certification schemes relevant to quality assurance and export markets. Across all crops, experts' familiarity with these standards and certification schemes and their reported coverage were relatively higher for fumigation, sanitary and phytosanitary (SPS) requirements and GLOBALG.A.P. The Hazard Analysis and Critical Control Point (HACCP), ISO 22000 Food Safety Management Systems and Food Safety System Certification 22000 (FSSC 22000) were commonly reported as available but with very limited coverage, alongside substantial uncertainty. There was greater uncertainty for Fairtrade, International Featured Standards (IFS), BRCGS Global Standard Food Safety, and organic certification, as responses were mostly 'I don't know', indicating limited familiarity with these schemes. Compliance with relevant food-safety and quality standards can facilitate access to international markets and enhance export competitiveness (Henson & Jaffee, 2008). Thus, greater attention is needed to certification awareness, compliance capacity, processing standards and product quality.

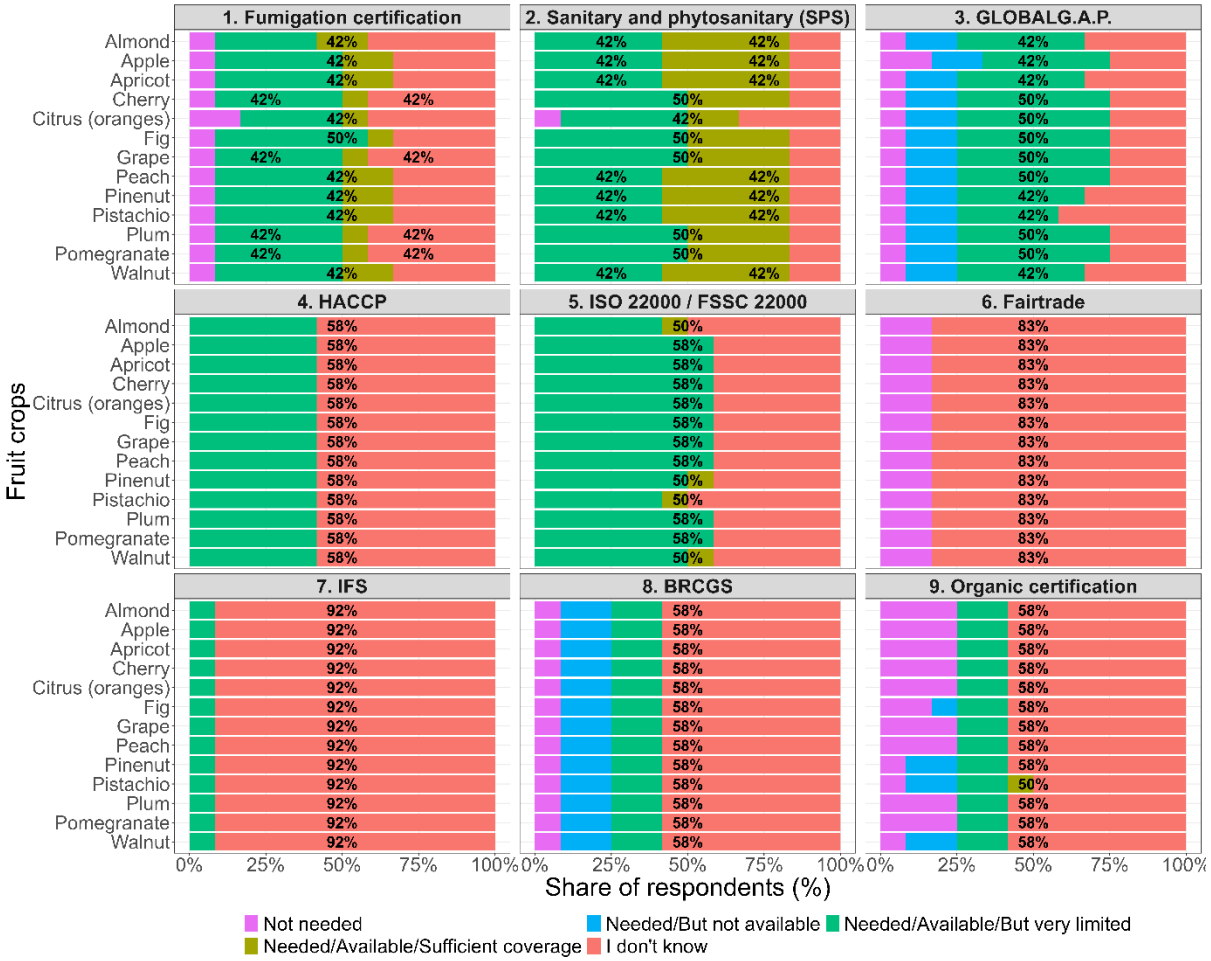

Figure S1. Expert response distributions on the need, availability and coverage of quality standards and certification schemes across fruit crops in Afghanistan.

Available literature and technical resources

Considerable work has been done to strengthen fruit value chains in recent decades. Although many challenges remain across the value chain, the existing studies provide information on best practices (Table S2). This information can help train and guide farmers in adopting these practices and also present opportunities for interventions for policymakers. In addition to full value chain studies, there are context-informed individual reports and manuals on other practices, such as establishing commercial orchards, reducing post-harvest losses, insect, pest, and disease management, harvesting and processing tools, better varieties, and export and quality standards, mostly available on the ANHDO and Roots of Peace websites. For fruits such as walnut, cherry, and mulberry, we did not identify detailed studies that could provide useful additional support.

The evolving citrus value chain

Afghanistan remains a net importer of citrus, largely kinnow (mandarin), because domestic production remains low relative to demand. Estimates indicate production of approximately 14,000 tons, while

recent statistics show imports of approximately 92,000 tons (FAO, 2021; NSIA, 2025). ANHDO (2015) estimated the total market size at 146,000 tons, illustrating the substantial domestic demand for citrus. Thus, a significant gap remains between domestic production and total demand. Despite the domestic production deficit and reliance on imports, part of domestic citrus production is exported, particularly oranges. Afghan citrus are in high demand in other countries within the region. The value chain has been evolving, and production is increasing as new orchards are established. The country's eastern region, which exhibits a Mediterranean-type climate, is suitable for citrus production (Giordani et al., 2014). Our findings show that, despite the overall production shortfall, the value chain performs better than other fruit value chains (Figure 3 in the main manuscript) with comparatively stronger performance concentrated in the production subsector. Thus, the adoption of high-yielding varieties, together with the expansion of new orchards, may be instrumental to closing the domestic supply gap. A recent study on the suitability of different fruits using a multicriteria analysis also found that citrus, particularly sweet orange and lemon, are highly suitable for expansion due to high profit margins, market value, and local demand (Mohammadi et al., 2023).
